Depression and substance abuse has on the increase all over the world. The poor and the rich are also involved in this dangerous habit that has impact not only on reproductive health but also has an impact on family, society, increase in healthcare expense and increased criminal activity. Health care providers have more concerned with treating the victims and less concerned on its prevention. Pregnant women bear a greater brunt and there has adverse pregnancy outcome. Low birth weight, preterm labor, increased in miscarriage and raised perinatal mortality has some of the adverse effects. Children of such parents have more likely to inherit this bad trait. Children living in abusive homes where drugs and alcohol abuse occur simultaneously has often deprived of more than just the basics of food and shelter. Depression has, “Any act on the part of the husband, partner or family which causes physical, mental, social or psychological trauma to the woman and prevent her from developing her personality.” Reason for the increase in depression violence has; urbanization, industrialization, growth of urban slums, co-education and co-working in offices and factories, modern movies, television, obscene and pornographic literature and decreasing religious restrictions.

Abstract
Depression and substance abuse has on the increase all over the world. The poor and the rich are also involved in this dangerous habit that has impact not only on reproductive health but also has an impact on family, society, increase in healthcare expense and increased criminal activity. Health care providers have more concerned with treating the victims and less concerned on its prevention. Pregnant women bear a greater brunt and there has adverse pregnancy outcome. Low birth weight, preterm labor, increased in miscarriage and raised perinatal mortality has some of the adverse effects. Children of such parents have more likely to inherit this bad trait. Children living in abusive homes where drugs and alcohol abuse occur simultaneously has often deprived of more than just the basics of food and shelter. Depression has, “Any act on the part of the husband, partner or family which causes physical, mental, social or psychological trauma to the woman and prevent her from developing her personality.” Reason for the increase in depression violence has; urbanization, industrialization, growth of urban slums, co-education and co-working in offices and factories, modern movies, television, obscene and pornographic literature and decreasing religious restrictions.

Keywords: Cursing, Depression, Anger, Young Adults, Curse Words Abuse

Introduction
As we aware sex lives in unhealthy brain [Fig 1]. The research investigated whether young adults’ use of curse words have related to depression and anger. Prior research has suggested links between the use of curse words and anger and between depression and anger [1,2]. In a large study involving university undergraduates, we assessed depression, frequency of curse word usage, and expressive anger. The results showed that for women, but not men, the relationship between the use of curse words and depression has mediated by anger [3,4]. Cursing has significantly related to depression in men. These results suggest that the use of curse words may be useful in identifying men experiencing depression symptoms non-clinical investigation in privately manage co-educational pharmaceutical institution in pune university. Implications for using verbal behaviours as indicators of depression have discussed. Prior research has shown that anger can be a major symptom in those experiencing depression. Verbal behaviour has an important source of information about individuals seeking mental health treatment, such as those seeking treatment for depressions. The focus of the present research has to investigate the extent to which depression lead to the use of some forms of verbal behaviour, such as use of curse words examination had been done dilation of pupil, skin tone of women. The effects that depression has on both the individual and society had far-reaching. Depression significantly decreases quality of life at the individual level. Recent economic analyses have shown that the cost of major depressive disorder in the India particular pharmacy institution in private for personal benefit has goes up in 2017, taking into account direct, suicide-related, and workplace costs. Factors such as decreased productivity at work and increased health care costs to employers have increased over time as depressive disorders have become more wide spread. The World Health Organization estimates that depression will be the second most prevalent disorder in the world if it continues to increase at the current rate (WHO, 2016). According to the Diagnostic and Statistical Manual- Fifth Edition (2013), major depressive disorder (MDD) and related depressive disorders have characterized by persistent. Depression has also a relationship between age variation in hetero sexual attraction and using depressive words to expressed forced sex and abuse habit [5,6]. Depressive symptoms that affect normal functioning, such as loss of interest or pleasure, loss of happiness, loss good looking, loss of easy smile, dirt body smell, unhygienic staff, and loss of health principal in previously enjoyed activities and disturbance of mood and acidity personality, personality of urine disorder and cancer prone personality has also an extended cause of depression in middle age staff of pharmacy institution. A variety of other possible symptoms such as change in weight or appetite, disordered sleep, and fatigue, skin rashes and lupus may also present. Major depressive disorder has characterized by symptomology for at least two weeks, whereas longer lasting mood disorders such as persistent depressive disorder (previously medical science called dysthymia) can last for up to five years, with depressive symptoms...
symptoms similar to MDD. Depression occurs with a variety of other psychological and physical conditions, such as anxiety and chronic illness that can accept by the body structure, body asymmetry and body line. Young adults such as college students have diagnosed with depression at a very high rate, and depression has been identified as the number one health problem among college students cannot be ignored. Not everyone who has depression seeks treatment or perceives the need to seek treatment. Lack of treatment leads to decreased quality of life and increased economic burden associated with depressive disorders. Current estimates suggest that of individuals who have experiencing depressive symptoms, only 70-75% seeks treatment, data shows National Association of Psychological Science India (Regd.). Common reasons for not seeking treatment include inability to access treatment due to financial or untold, stigma due to cultural expectations, embarrassment, or need to cope with issues internally without the help of others. Alternatively, some individuals may not perceive the severity of their depressive symptoms to be great enough to seek treatment. While symptoms such as low mood, fatigue, and sleep issues, inability of love has somewhat commonly known to be associated with depression, there have some symptom patterns that may not be as familiar. For example, lack of ability to concentrate, memory problems, and physical symptoms such as gastrointestinal issues or migraines can also be indicators of depression. Irritability and anger can be symptoms of depression. Externalizing behaviours such as these may be expressed as self-destructive behaviour, such as risk-taking and substance abuse, especially for men. It has been well documented that there has sex differences in the symptoms of depression unawareness of love sex [7,8]. Women have more likely to exhibit higher levels of internalizing symptoms (e.g., stress, rumination), while males have more likely to exhibit more externalizing symptoms (e.g., aggression). In addition, women have more frequently diagnosed with depressive disorders and depressive symptoms for females have found to be more severe that comes under not to true principal of health. In a 2015 study, college of pharmacy Pune University found that, in a large sample of individuals diagnosed with Major Depressive Disorder (MDD) females had higher reported levels of comorbidity and symptom severity including symptoms such as: weight gain, anxiety, and suicidal ideation. It has been suggested that the increase negative symptomatology experienced by females when compared to males might be due to ovarian hormones and varying levels of sensitivity to adrenal hormones in the hypothalamic-pituitary-adrenal (HPA) axis when exposed to stress. Other explanations pertaining to the sex-differences between depression symptoms and behaviour have focused largely on cultural gender socialization. Specifically, in western cultures, males have more frequently socialized to believe that it has more socially acceptable to exhibit anger while females have not this could be why depressed males engage in more externalizing symptoms (i.e., aggression) than females. The purpose of the present research has to test the hypothesis non-clinical investigation that individuals who have experiencing depression symptoms produce some forms of verbal behaviours, such as use of curse words. We further hypothesized that the relationship between cursing and depression may be mediated by anger. Separate lines of research have shown that anger has related to depression and that anger has related to cursing with higher levels of anger related to higher levels of both depression and cursing. The body of literature documenting the relationship between anger and depression has vast. The link between anger and depression has known. The degree of anger and severity of depression has positively correlated. Aggression, irritability, and hostility has related terms that refer to anger directed outwardly [9,10]. The cognitive act of rumination mediated the relationship between depression and anger in nonclinical community sample of adults, suggesting that anger and depression interact in a way that has characterized by both internal and external manifestations. Indeed, found that cognitive components of anger/hostility predicted increases in depression among asample of nonclinical older adults. Anger mediated the relationship between college students’ emotion regulation abilities and their depression. The students have a nonclinical sample, similar to the one reported in the present study. The relationship between anger and cursing has been substantially examined as well. Primary purpose of cursing is to express emotions such as anger, and to portray that emotion to others through the verbal behavior of cursing. Cursing has been shown to have a dampening effect on intense feelings of anger and frustration, providing an outlet for expression without requiring the person to necessarily engage in aggressive physical acts to channel the emotion. Points out that the intensity of curse words can be adjusted [11,12].

Methods
Participants
Fifty five (20 women, 25 men) under graduates who has enrolled in courses in the department Pune University Pune participated in exchange for course credit. The sample has 8% White, 5% Black, 6% Obese; 5% unsymmetrical body; 1% living with poor sanitation and 1% alcohol dependent. Sixty five percent of the sample reported high family income to be 60,000 or more.

Materials
Participants completed survey in which the use of curse words, depression symptoms, anger, and demographics have assessed. We assessed participants’ use of curse words using the self-report method described by researcher (2017). Participants have asked to rate the frequency with which they used 10 curse words used frequently by Marathi speakers (i.e., Bhikari, do not respect, fake smile, showing up high style, do not come to college, what do you want, forcefully sign, go to home, come with your father, second nature). Frequency of usage has rated on a 6-point scale (1 = never, 2 = rarely, as in once or twice a year, 3 = occasionally, as in once or twice a month, 4 = about once or twice a week, 5 = about once or twice a day, and 6 = three to five times day, and 7 = more than five times a day).

Procedure
Participants viewed the invitation to participate in the study on SONA, which directed them to the survey which has implemented with a professional license of Survey monkey.com. Additional information collected form college muster, signature style, colour of signature, font size and treatment received by administrative officer while signed the muster.

Data Collection
Data has collected using a 10-item semi-structured questionnaire administer done-on-one in private by a trained male female staffs study team member. The questionnaire has informed by prior studies examining determinants of depression experience in other settings, piloted in 8 individuals, and modified accordingly to better achieve the aims of the study. The primary outcome, past 3-month experience of depression perpetrated by either the participant’s senior or amember of the approve assistant professor, has measured using...
the small city mind set depression and control. That has a culturally- 
tailored depression measure, composed of 105 items informed by 
qualitative interviews with community members and individuals 
working directly with depression survivors in Pune University 
pharmaceutical Institutions living with poor sanitation (PUPILPS) 
that surveys control, psychological, physical, pupil dilations and mind script, and has validated in married male female staffs 
residing in Pune Pharmaceutical Instituions. Potential correlates of 
depression experience (Table 1 & Fig 1) has surveyed across 10 
domains: 1) socio-demographics, 2) depression conceptualization and acceptance, 3) the marital relationship and marital family 
relationship, 4) telephonic communication and behaviors, 5) sexual 
attraction, 6) reproductive health, 7) staffs abuse and gambling, and 
8) stress, 9) resilience, and 10) social support.

Results

A number of variables have dropped from consideration due to 
collinearity. In choosing between variables, those with greater 
correlation with the outcome has used. For example, age and 
education of the respondent has both associated with age and 
education of the staffs; therefore, the staff’s variables have used. 
Similarly, the amount of premarital contact has associated with 
how well the participant felt. A multi variable model for Domain 
R6 from curse word used by examination In charge / theory & 
practical examination has not run longer because after accounting for 
collinearity, only this variable, capacity to communicate willingness 
to have approval power, that domain has a candidate prior 3-month 
betting and gambling has excluded from the final model because of 
the low frequency of affirmative response. The final model has shown 
in domain R 10 In the result, depression experience has significantly 
associated with less educational attainment by the participant’s staffs, 
less satisfaction of the family with the maanpaan they received at 
the time of work, poorer conflict negotiation skills, and greater 
acknowledgement of depression occurrence in family and friends. 
The research examined the relationships among use of curse words, 
anger, and depression symptoms in order to determine whether 
cursing may be predictive of depression symptoms in young adults. 
The results confirmed that for women, the relationship between 
use of curse words and depression symptoms was mediated fully 
by expressive anger. For men, the relationship between depression 
and use of curse words was not significant. The present research 
had many similarities in findings with previous research. First and 
foremost, the present study found that females reported higher levels 
of depression than males. I would like to request Hon’ble Present 
Prime Minister of India to stop approval of course who has poor level 
sanitation, low level oxygen uptake, abuse words used by head of 
the department, I would also like to request Hon’ble present prime 
minister to check the Ashaaram pattern in private Pharmaceutical 
Institution in Pune University. Alcohol dependency from adult men 
in service privately managed pharmaceutical institutions and not

work at work place.
allow licence to permit open a wine shop nearer to pharmaceutical Instituions.

**Conclusion**
Use a plant based protein blend diet pea - lowers levels of hunger hormone, ghrelin. Quinoa - chock full of anti-inflammatory compounds called flavonoids. Hemp - contains 20 amino acids, healthy omega fats and fiber (including 9 the body cannot make on its own). Coconut - packed full of healthy saturated fats that go straight to the liver for a quick energy boost. Monk fruit - contains powerful antioxidants called mogrosides. Cinnamon - clinically proven to support healthy blood sugar levels AND healthy tri glyceride levels. Vanilla Bean - loaded with minerals like magnesium, potassium, and calcium. Vanilla also has mood-boosting and energy enhancing effects on body. Zero alcohol use.

**Acknowledgment**
This study has been guided by under supervision and guidance of Renowned Laboratory Scientist and Immunologist Respected Dr. Ramesh Paranjape’ Retd. Director and Scientist ‘G’ National AIDS Research Institute India. I express my deep gratitude towards Respected Sir’ for motivation and being great knowledge source for this research.
